

of yarn under investigation. The overall trend is that an increase in bamboo content decreases yarn tenacity. Here again, 50:50 blended yarns show values that are comparable with those of 100% cotton yarn for all three sets of yarn.

The influence of bamboo content in blended yarn on yarn elongation is displayed in **Figure 1.f**. The decrease in elongation with an increase in bamboo content is clearly visible. The elongation of 50:50 blended yarns is seen to be similar to that of 100% cotton yarn, irrespective of the yarn linear density.

While the overall trend appears to indicate that the bamboo content distinctly influences yarn properties, it may also be observed that the properties of the 33:67 blend show values that appear to deviate from the trend, especially in the case of the number of neps and yarn tenacity. The cause of the visible departure from consistency is not clear at present, and more elaborate work will need to be done to ascertain the reasons. Moreover further work is planned for a study of the comfort properties of knitted fabric produced from these yarns.

Conclusions

The following conclusions were arrived at from the above study.

- An increase in the bamboo content of bamboo:cotton blended yarn has a significant influence on the overall quality of the yarn in terms of yarn imperfections and mechanical properties, such as strength and elongation, for the linear density of yarns studied.
- It is also interesting to note that the quality of 50/50 bamboo/cotton blended yarn is most closely comparable with that of 100% cotton yarn. Hence it would seem advisable to blend cotton with bamboo to obtain the necessary fabric comfort rather than opting for 100% bamboo, which has less desirable properties and is also not cost-effective.

Acknowledgment

The authors would like to express their sincere thanks to Textile Research Centre, TIFAC-CORE in Textile Technology and Machinery, of Kumaraguru College of Technology, Coimbatore, India for permission to process all the samples in their advanced manufacturing laboratory, to the Textile Technology Department of Thiagarajar Polytechnic

College for performing most of the tests, to M. Logeshwaran, K. Valliyappan, S. Prabu and O.R. Venkadesh for their assistance in the experimental part and lastly to the management of Sona College of Technology for permission to use the laboratory facilities.

Institute of Biopolymers
and Chemical Fibres

Multifilament Chitosan Yarn

The Institute of Biopolymers and Chemical Fibres is in possession of the know-how and equipment to start the production of continuous chitosan fibres on an extended lab scale. The Institute is highly experienced in the wet – spinning of polysaccharides, especially chitosan. The Fibres from Natural Polymers department, run by Dr Dariusz Wawro, has elaborated a proprietary environmentally-friendly method of producing continuous chitosan fibres with bobbins wound on in a form suitable for textile processing and medical application.

Multifilament chitosan yarn

We are ready, in cooperation with our customers, to conduct investigations aimed at the preparation of staple and continuous chitosan fibres tailored to specific needs in preparing non-woven and knit fabrics.

We presently offer a number of chitosan yarns with a variety of mechanical properties, and with single filaments in the range of 3.0 to 6.0 dtex.

The fibres offer new potential uses in medical products like dressing, implants and cell growth media.
